

Raspbian Desktop

Discover

Once you have configured the operating system to start in graphical mode (OS1-Config), the RaspberryPi should always load into the Raspbian desktop.

Learn

The desktop has short-cuts for different programs that can be run with a double-click of the mouse. In the bottom-left, there is a menu and other small icons that run with a single click.

Take a look at the black/green graph near the bottom-right corner too.

Apply

Find the “File Manager” under the Accessories menu, (it is also next to the menu icon).

Scratch is on the desktop, but also in the Education menu.

If your RaspberryPi is connected to the internet, open the Midori Internet browser.

Find another interesting program to open, and try guess what it is for.

If you have too many programs open, you may have to wait some time for new programs to load. Close programs that you don't want open anymore.

Hold the “Alt” key and then click-and-drag on windows to move them around the desktop.

Teach

If you found the small File Manager icon, share it with someone who has tried but cannot find it.

Also, if you found an interesting program, share it with someone else.

Discuss with someone what you think the green/black graph is near the bottom-right corner.
