

Congratulations! You are about to construct a computer.

First step, connect all the components, with the last one being the USB power supply. It is best to hold the edges of the board, and not the small components on the board.
The cables will only fit in the right place, so it's impossible to plug things the wrong way.

1

Learn + Apply on your own or with another.

Extra Information:

1. SD card: the computers memory to hold programs and your creations
- 2a. Display cable: connects to a display that shows your creations
3. Keyboard and mouse: allows you to interact with your creations
4. (optional) network connection: to access the Internet or other computers
5. Power: Bring the computer to life with electricity

Now just wait for the RaspberryPi computer to start.

Teach others if they are stuck.
