

## NOOBS Menu for installing operating systems

### Discover

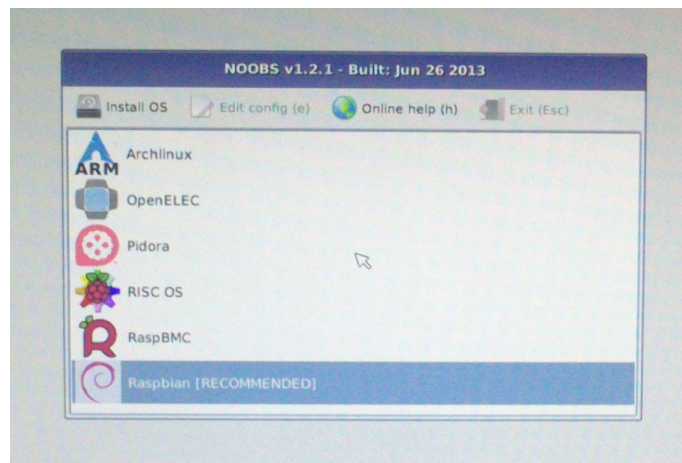

There are two ways to get to this menu:

- the first is when you have powered the RaspberryPi for the first time
- the second is if you hold down the **shift key** when the Raspberry Pi powers up

(If you can't get to the NOOBS menu. See OS3-SDCard)

### Learn

The NOOBS menu will show you a list of Operating Systems (OS's) that can be installed. Installing an OS takes some time, because it is writing over a lot to the SD card's memory.

**Raspbian** is the most convenient way to start using a Raspberry Pi.

### Apply

Use the mouse or keys, to Install **Raspbian**, this could take around 10 minutes.

You will see it progress, and then reboot to the blue/white raspi-config menu (OS1-Config)

### Teach

While Raspbian is being installed, you can read the helpful messages.

Also take a moment to help others if they need.

### Discover

OS1-Config: configuration menu after NOOBS.

CLI1-Files: viewing files from the command line. OS3-SDCard: prepare your own NOOBS SD card.

## OS1-NOOBS

**Unlocks:** OS1-Config, CLI2-Files
